Dear Hiring Managers at DeepMind,

I would like to apply to the Research Engineer, Climate role (or any other relevant roles if appropriate). After leaving my academic career of researching fluid dynamics with a degree in Applied Mathematics, I have worked in the financial sector, building models to measure risks of trading positions in banks. It involved collecting/cleansing/exploring financial data (usually time series), applying mathematical methods and statistical learning techniques, visualising data and results, and implementing the model (in Python, C#). We collaborate with colleagues in technology to develop and deploy models in production systems.

Whilst I have enjoyed working in the sector, I have a strong desire to work in a good technology company and solve problems that matter to the wider communities. Clearly, the climate problem is one that matters more to society than any others, motivating me to apply to the role.

In addition to my resume, please find my responses to the four questionnaires in the application.

Sincerely,

Youngsuk Lee
